

NexaBank Full Deployment Guide (Render + PostgreSQL)

Phase 1: Preparing Your Database

1. Go to Neon.tech or Supabase and create a free PostgreSQL database.
2. Once created, copy the Connection String (starts with postgresql://).
3. Add your connection string to your local `.env` file to test it locally.

Phase 2: Push to GitHub

Create a GitHub repository and push all your project files to the main branch.

Note: Your .env file is safely ignored by git and will not be pushed.

Phase 3: Deploy Backend on Render

1. Go to Render.com and create a New Web Service.
2. Connect your GitHub repository.
3. Set Build Command: `pip install -r requirements.txt`
4. Set Start Command: `uvicorn main:app --host 0.0.0.0 --port $PORT`
5. Under Environment Variables, add **DATABASE_URL** and paste your Neon.tech connection string.
6. Add a variable named **SECRET_KEY** and put in a long secure, random password string.
7. Deploy and copy your new backend URL (e.g. <https://nexabank-api.onrender.com>).

Phase 4: Deploy Frontend on Render

1. Create another New Web Service on Render exactly as before.
2. Set Build Command: `pip install -r requirements.txt`
3. Set Start Command: `streamlit run streamlit_bank_ui.py --server.port $PORT --server.address 0.0.0.0`
4. Under Environment Variables, add **API_BASE_URL** and paste your backend URL from Phase 3.
5. Deploy. You will receive a URL for your live web application!
